

HME103-Principles of Nutrition

Components in foods and their relationship with health: Lipids

Lesson Code: HME103-Principles of Nutrition

Instructure: Assoc.Prof. Dr. Elif Feyza TOPDAŞ

LIPIDS

One of the basic organic compounds of living things on Earth is lipids. Lipids are among the essential nutrients of humans and animals. Fats are also lipids.

They are insoluble in water and soluble in organic solvents such as chloroform, benzene, petroleum ether and ether, including oil and similar substances.

Lipids are important sources of nutrients and energy because they are broken down in metabolism and converted into new products.

Apart from C, O and H atoms, they also contain N, P and S, although they are rare.

As a result of burning one gram of them, they give 9.1 kcal of energy. Therefore, they are the most economical energy sources.

They make salt with alkalis. This is called saponification.

CLASSIFICATION OF LIPIDS

- > Simple lipids:
- Oils, waxes, color waxes, sterol esters, esters of triterpenic alcohols
- > Compound lipids:
- -Phospholipids: Lecithin, cephalin, sphingomyelin-Glycolipids (cerebrosides)
- -Lipoproteins
- Lipid-like substances: Sterols (cholesterol analogs), lipovitamins, hydrocarbons, pro- and antioxidants, lipochromes

The Functions of Fats in Body Work

- •They provide energy. They provide the body with more than twice as much energy as carbohydrates and proteins. In other words, fats provide approximately 9 kcal per gram, while carbohydrates provide 4 kcal per gram.
- •They are carriers of fat-soluble vitamins A, D, E and K.
- •They ensure the intake of essential fatty acids necessary for growth and normal metabolic events.
- •They leave the stomach late. Therefore, they help create the feeling of satiety.
- •They surround and support the organs and protect them against external factors.
- •They prevent heat loss from the body. They are one of the building materials of the cell.
- •Essential fatty acids that cannot be synthesized in the body are taken with the fats found in the food.

Fat sources

Vegetable oil sources: Oil obtained from plants is referred to as vegetable oil or by the name of the plant from which it is obtained such as olive oil, sunflower oil, and corn oil.

Vegetable oils are unsaturated fats. Foods such as walnuts, hazelnuts and peanuts are also rich in fat and contain unsaturated fat.

Vegetable oils consist of mono and polyunsaturated fatty acids. Olive oil and hazelnut oil contain monounsaturated fatty acids, while other vegetable oils (sunflower, corn germ, soy) contain polyunsaturated fatty acids.

Fat sources

• Sources of animal fat: Besides visible fats such as butter, suet, and tail fat, there are also fats in animal-derived foods such as all kinds of meat, chicken, fish, milk, and eggs.

FATS AND CONSTITUENTS

Almost all fats and oils are triglycerides, which are formed by the esterification of fatty acids (R-COOH) and glycerol $[C_3H_5(OH)_5]$, a trivalent alcohol.

Triglyceride (fat) formation

Fats are esters (glycerides) made of fatty acids with glycerol, a trivalent alcohol.

Chemical reaction • • TRIGLYCERIDES triglycerides 3 fatty acids glycerol

shutterstock.com · 1701868573

H₂O is released

If the 3 OH groups (alcohol group) of the glycerol molecule are esterified with 3 molecules of fatty acids, it is called **triglyceride**.

If all 3 of these 3 molecules of fatty acids are the same fatty acid, it is called **simple triglyceride**; if at least one of them is different, it is called **mixed triglyceride**.

Additionally, if 2 of the OH groups of glycerol are esterified with fatty acids, it is called **diglyceride**, and if one is esterified, it is called **monoglyceride**.

CH ₂ OH	CH ₂ OOC-R	CH ₂ OOC-R	CH ₂ OOC-R
СНОН	СНОН	CH ₂ OOC-R	CH ₂ OOC-R
CH ₂ OH	CH ₂ OH	CH ₂ OH	CH ₂ OOC-R
Gliserol	Monogliserit	Digliserit	Trigliserit

FATS AND CONSTITUENTS

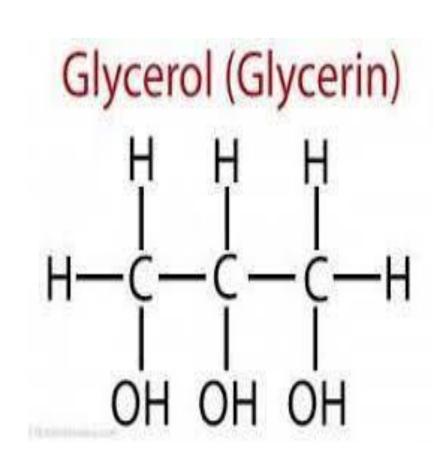

1. Glycerol (Glycerin)

Glycerol is a tri alcohol containing three OH groups found in fats and various lipids.

Its closed formula is $C_3H_8O_3 = C_3H_5(OH)_3$.

It constitutes approximately 10% of the oil.

It is a moisture attractive, colourless, viscous liquid.

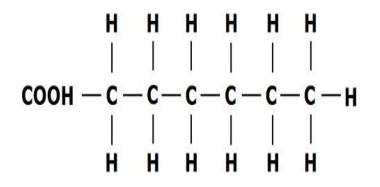

2. Fatty Acids

Fatty acids are long-chain organic acids with 4-24 carbon atoms.

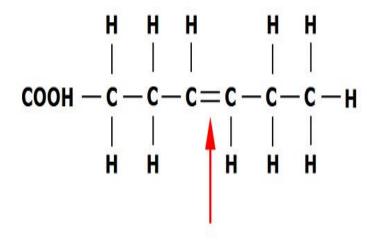

Fatty acids are named according to the number of carbons (C) in the molecule and the number of double bonds between the Cs.

They are divided into two main groups: a.Saturated fatty acids b.Unsaturated fatty acids

Those without double bonds are called saturated fatty acids, and those with double bonds are called unsaturated fatty acids.

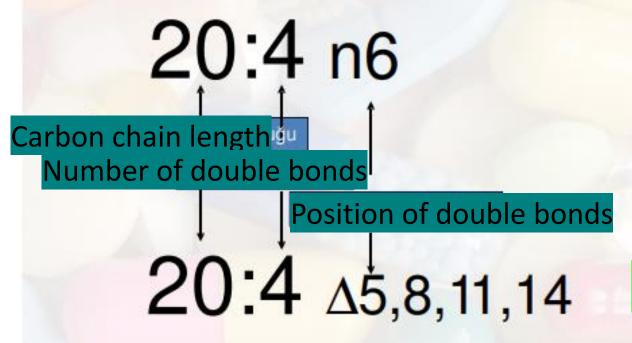

Saturated fat (No double bonds)

Unsaturated fat (There is double bond)

Naming Fatty Acids

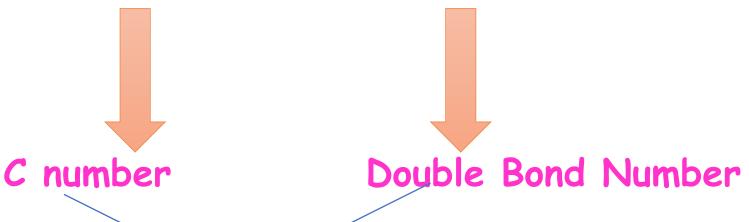

Standard naming

n-definition or W-definition

Δ-definition

 $10:0^{2}(10 C, \text{ no double bonds}, 0)$

18:1 (18 C, there is a single double bond)

20:4 (20 C, There are 4 double bonds)

Fatty acids

They are classified according to their various characteristics

According to the number of C

1. Short chain

2. Medium chain

3.Long chain

According to the double bonds between C atoms

1. Saturated

2. Unsaturated

w-6, w-3

Monounsaturated
 Polyunsaturated
 n-6, n-3 or

According to the state of synthesis in the human body

1. Essential

2. Non-essential

Classification of fatty acids according to the number C

- 1. Short Chain Fatty Acids <6 C
- (2,4 C)
- 2. Medium Chain Fatty Acids at 6-10 C
- (6, 8, 10 C)
- 3. Long Chain Fatty Acids >10 C
- (12 C and above)

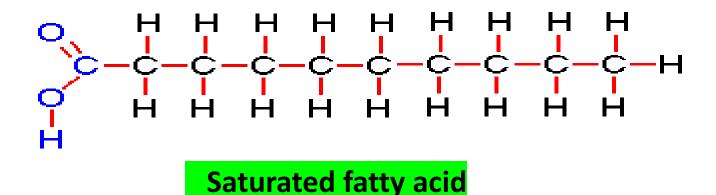

2a. Saturated Fatty Acids:

They are fatty acids that do not contain double bonds in their structure.

Since each carbon atom is bonded with hydrogen, they cannot absorb any other hydrogen into their structure.

Their general formula is CnH₂nO₂.
Oils containing high amounts of saturated fatty acids are generally solid.

- Saturated fatty acids can be synthesized in the human body.
- Even if no fat is eaten, these types of fatty acids can be synthesized from molecules formed by carbohydrate and protein metabolism.
- When taken in excess, they increase cholesterol levels and pose risk factors for heart diseases, cancer and obesity.

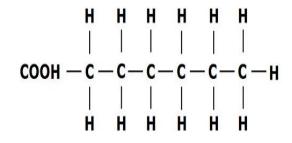

Saturated fatty acids

Name of fatty acid	Carbon skeleton	Formula
Acetic acid	2: 0	CH ₃ COOH
Propionic acid	3: 0	CH ₃ CH ₂ COOH
Butyric acid	4: 0	CH ₃ (CH ₂) ₂ COOH
Caproic acid	6: 0	CH ₃ (CH ₂) ₄ COOH
Caprylic acid	8: 0	CH ₃ (CH ₂) ₆ COOH
Capric acid	10: 0	CH ₃ (CH ₂) ₈ COOH
Lauric acid	12: 0	CH ₃ (CH ₂) ₁₀ COOH
Myristic acid	14: 0	CH ₃ (CH ₂) ₁₂ COOH
Palmitic acid	16: 0	CH ₃ (CH ₂) ₁₄ COOH
Stearic acid	18: 0	CH ₃ (CH ₂) ₁₆ COOH
Arachidic acid	20: 0	CH ₃ (CH ₂) ₁₈ COOH
Bahenic acid	22: 0	CH ₃ (CH ₂) ₂₀ COOH
Lignoceric acid	24: 0	CH ₃ (CH ₂) ₂₂ COOH
Serotic acid	26: 0	CH ₃ (CH ₂) ₂₄ COOH

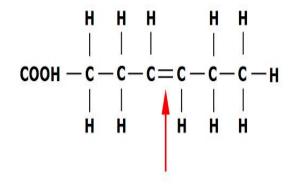

2b. Unsaturated Fatty Acids

- They are found in natural oils
- They contain one, two or more double bonds between C atoms in the molecule.
- They are the best sources of essential fatty acids that the body needs.
- Oils containing large amounts of unsaturated fatty acids are generally liquid at room temperature.
- Unsaturated fatty acids are common in vegetable oils, olives and oily fish.
- Unsaturated fatty acids are easily oxidized because they contain double bonds. For this reason, it is easy for the oil to spoil.
- If they are hydrogenated, the double bonds are opened and hydrogen is added to them, turning them into saturated fatty acids.

Saturated fat (No double bonds)

Unsaturated fat (There is double bond)

Unsaturated fatty acids

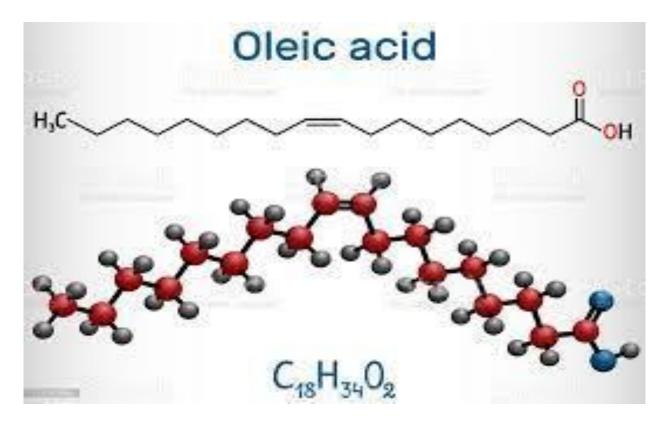

Name of fatty acid	Carbon ₁ skeleton	Formula
Myristoleic acid	$14:1\Delta^9$	CH ₃ (CH ₂) ₃ CH=CH(CH ₂) ₇ COOH
Palmitoleic acid	$16:1\Delta^9$	CH ₃ (CH ₂) ₅ CH=CH(CH ₂) ₇ COOH
Oleic acid	$18:1\Delta^9$	CH ₃ (CH ₂) ₇ CH=CH(CH ₂) ₇ COOH
Vacsenic acid	$18:1\Delta^{11}$	CH ₃ (CH ₂) ₅ CH=CH(CH ₂) ₉ COOH
Nervotic acid	24: $1\Delta^{15}$	CH ₃ (CH ₂) ₇ CH=CH(CH ₂) ₁₃ COOH
Linoleic acid	$18:2\Delta^{9, 12}$	CH ₃ (CH ₂) ₄ CH=CHCH ₂ CH=CH(CH ₂) ₇ COOH
Linolenic acid	$18:3\Delta^{9, 12, 15}$	CH ₃ CH ₂ CH=CHCH ₂ CH=CHCH ₂ CH=
		CH(CH ₂) ₇ COOH
Arachidonic acid acid	$20:4\Delta^{5,8,11,14}$	CH ₃ (CH ₂) ₄ CH=CHCH ₂ CH=CHCH ₂ CH=CHCH ₂ CH=
		CH(CH ₂) ₃ COOH

Unsaturated Fatty Acids

- . Unsaturated fatty acids (Unsaturated Fatty Acids).
- a. Mono Unsaturated Fatty Acids
- MUFA. Contains a single double bond.
- b. Polyunsaturated (Poly Unsaturated Fatty Acids
- PUFA. Contains more than one double bond.

Monounsaturated Fatty Acids (MUFA) $C_nH_{(2n-2)}O_2$

- Myristoleic Acid (14:1)
- Palmitoleic Acid (16:1)
- Oleic acid (18:1)

Polyunsaturated

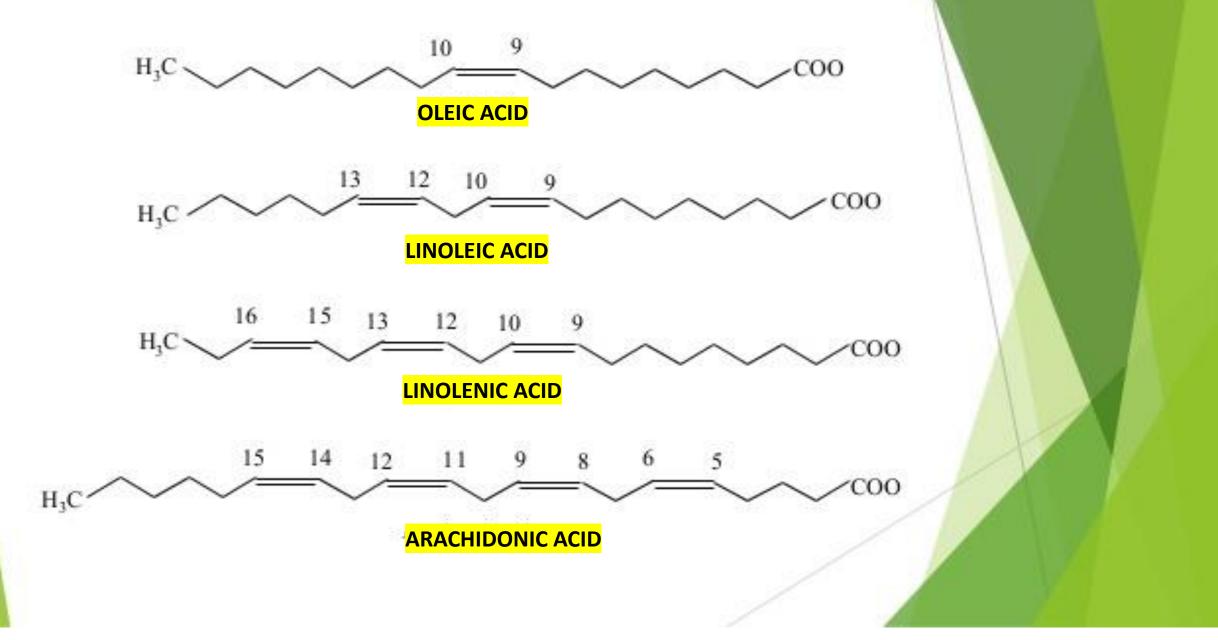

Fatty (PUFA)

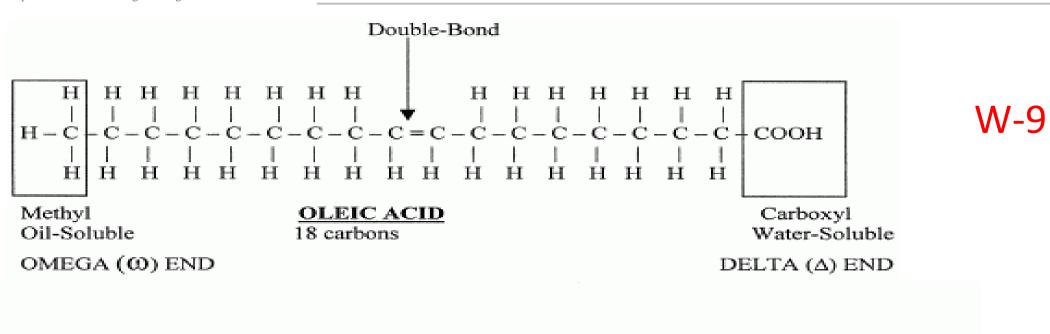

Acids

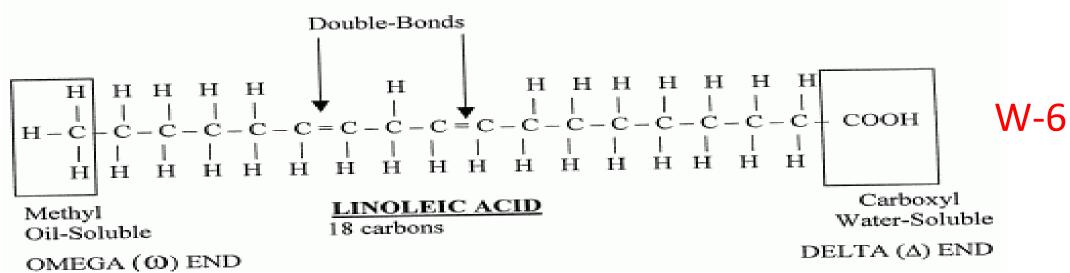

There is more than 1 double bond in the C chain.

- •Linoleic acid [C18:2 (w-6); 2 double bonds with 18 C atoms],
- •Linolenic acid [C18:3 (w-3); 18 C atoms and 3 double bonds],
- •Arachidonic acid (C20:4 (w-6) with 20 C atoms and 4 double bonds),
- •Eicosapentaenoic acid (EPA; C20:5 (w-3); 20 C atoms and 5 double bonds),
- •Docosahexaenoic acid (DHA; C22:6 (w-3); 22 C atoms and 6 double bonds).

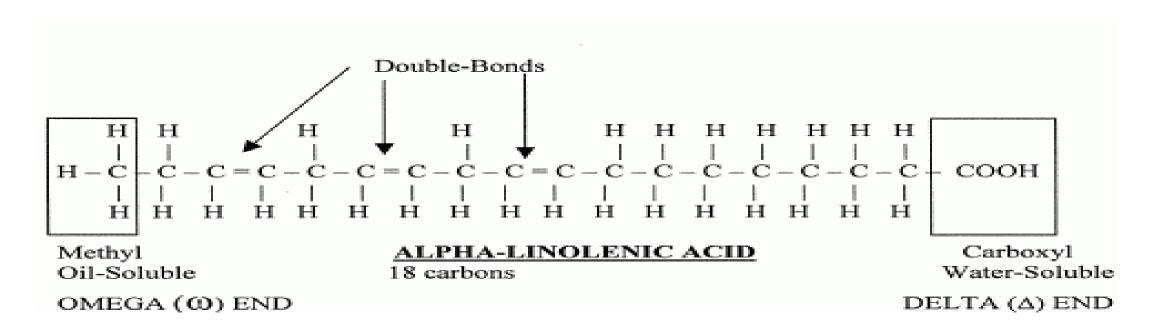

Question: W???

Answer
